RÉMANENT Release of G'MIC 1.5.8.4

 par [Ronounours](#) dit :

Here is another update of the G'MIC framework, numbered **1.5.8.4**. Here is the Changelog :

New features:

- New mailing list for developers and contributors to the G'MIC project has been created. You can access it here : lists.sourceforge.net/lists/listinfo/gmic-developers
- New command '-imageblocks3d' and corresponding plug-in filter 'Rendering / 3d blocks', that transform an image into a set of connected 3d blocks (*backported* to 1.5.8.x).

- New filter 'Degradations / Blur [depth-of-field]', to allow the rendering of 'focus blur' on your images :

Improvements:

- Command '-endian' now accepts an optional 'datatype' argument that allows to force the change of endianness of pixel data assuming they have a certain datatype (may be different than the working datatype of course).
- Default compiled version now disables the usage of command '-type' (although it is possible to use it as before in the 'full' compiled version). The gain on the binary size for the cli interface 'gmic' is x3 !
- Command '-output' has new options for .tiff files and .cimg[z]. Now you can specify the datatype used to output tiff files, without having to explicitly change the pixel types (using command '-type').
- Command '-apply_files' can now force output files to have a certain extension instead of re-using the input filename extensions.
- New waiting mode for threads run with '-parallel'. Now you can wait for a thread immediately, at command return, at process return or never.
- Integrated math parser now understands the 'med()' and 'kth()' functions which respectively return the median value and the k-th smallest of the specified arguments.
- Reduced the stack footprint required by the main parser function, by doing dynamic memory allocation when necessary.
- Request for a (higher) minimal stack size when possible, to avoid crashes on recursive calls.
- Improved filer 'Arrays & tiles / Extract objects', with new output modes :

- Command '-inpaint' has been improved, with three new 'simple' inpainting modes available (high-connectivity average and low/high-connectivity median), as well as the addition of a new parameter 'lookup_increment' to the patch-based inpainting algorithm.

Bug fixes:

- Fixed: When an error occurred in a .gmic file, the displayed line number or the

destroyed at command return.

[lylejk](#) dit :
Agree with gonz; shared this cool new feature at GIMPChat. :)
il y a 3 semaines ([permalien](#))

[lylejk](#) dit :
For 3d Block, can you add a position option. When you tilt the result
enough and use a large FOV, the image tends to be located in the
lower part of the layer so it would be cool to position it up. Even better
would be an auto layer size increase so that the render won't get
clipped. That actually would be better. :)
il y a 3 semaines ([permalien](#))

[dtschump](#) dit :
You can already set the position of the rendering (with latest filter
update).
To control the size of the object (and be sure it doesn't become too big),
there is the "Size" parameter.
il y a 3 semaines ([permalien](#))

[lylejk](#) dit :
Thanks David; just needed to refresh again. :)
il y a 3 semaines ([permalien](#))

[lylejk](#) dit :
Wonder if a legos preset could be made with the added 3D depth?
Have done 2D lego renders already, but to create the 3rd (stack)
dimension has eluded me. :)

[glowster2013](#) dit :
Not sure if I should ask here.. I am trying to paste gmic in the plugin
folder in the global folder but I am not able to paste it it says I don't have
permission.. How do I get around that? I am the administrator.. Thanks,
Dave
